

A neighbor losing a healthy 64-year-old father to COVID-19, prompted this call to action and to take to the streets, because truth is too often censored by Google, YouTube, Facebook and Twitter. This is not intended to offer medical advice or recommend any course of treatment, but simply to inspire independent study and shed some light on the subject through available information.

Out of 2,200 COVID-19 patients that Dr. Vladimir Zelenko and his team saw in New York, they sent about 2/3 of the younger and healthier patients home to get better on their own, with monitoring by phone to check for worsening symptoms. The remaining 1/3 that were in the elderly and high-risk category **were treated immediately** upon the presentation of symptoms or "clinical suspicion" of COVID-19, with **hydroxychloroquine+zinc+Azithromycin**, administered for 5 days. According to Dr. Zelenko it is important that treatment begin within the first 5 or 6 days after the initial onset of symptoms, without waiting for the results of a test to be returned. All too often the tests return false negatives as in my neighbor's father's case, that received 5 false negatives before the positive, which resulted in delayed treatment and death. **Out of 2,200 patients, Dr. Zelenko and his team only lost 2**, one of which had advanced leukemia and the other whose infection was already too advanced when he initially sought treatment. **That's a 99.9% success rate overall, or 99.7% success rate over treated patients, with a \$20 outpatient regimen.** What has become known as the "Zelenko Protocol", has been employed very successfully since March in the U.S. and the same or similar is administered around much of the world and has been adopted by entire nation-states. There are risks involved with all medication, however hydroxychloroquine has a 65-year track record of safety that the American Association of Physicians and Surgeons suggests demonstrates it to be safer than aspirin, Tylenol or Benadryl. It is available over the counter in many countries and should be in the U.S. as well, just as it was in France for over 50 years.

Regarding association with arrhythmia when combined with Azithromycin, according to Dr. Harvey Risch, professor of epidemiology at the Yale School of Public Health: "Early **outpatient** illness is very different than later hospitalized florid disease and the treatments differ. **Evidence about use of hydroxychloroquine alone - or of hydroxychloroquine+azithromycin in inpatients - is irrelevant concerning efficacy of the pair in early high-risk outpatient disease. Five studies, including two controlled clinical trials, have demonstrated significant major outpatient treatment efficacy.** Hydroxychloroquine+azithromycin has been used as standard-of-care in more than 300,000 older adults with multicomorbidities, with estimated proportion diagnosed with **cardiac arrhythmias attributable to the medications 47/100,000 users, of which estimated mortality is <20%, 9/100,000 users**, compared to the 10,000 Americans now dying each week. **These medications need to be widely available and promoted immediately for physicians to prescribe.**" (this was spiked by the media)

By way of comparison a 15% mortality rate among elderly and high-risk patients equates to a **15,000/100,000 chance of mortality from untreated COVID-19, compared to a 9/100,000 chance of arrhythmia related mortality from HCQ+AZ among a similar group.** Dr. Risch and Dr. Zelenko also suggest Doxycyclene may sometimes be used in place of Azithromycin if there are concerns.

Well over a hundred thousand Americans have died unnecessarily and another 100,000 are "scheduled" to die of COVID-19, because they are not being prescribed a commonly administered, 99+% effective, \$20 treatment for COVID-19 - **on a timely basis** - that has been saving lives all around the world since at least March of 2020. Perhaps there is better. Investigate the options **before** you get sick. Please save file, scan, copy, email, print, pass out at gatherings or even on street corners. You could save a life.
