

Will the Commonwealth of the Bahamas continue to follow the WHO and U.S. FDA, NIH and CDC's misguided lead during the COVID-19 pandemic and wind up following the U.S. off of what has been our deadly cliff? As of the first few days of October the U.S. was still averaging over **700 COVID-19 deaths every day** which could easily be **reduced by 3/4 to just 175 per day over a period of just a couple of weeks**, if all U.S. treating physicians simply followed the lead of doctors in other countries that adopted widespread *early outpatient* treatment of COVID-19 with hydroxychloroquine (HCQ) that, as a result, enjoy a **72% lower death rate** than countries like the U.S., Mexico, the U.K. and France whose citizens continue to be sacrificed as a result of limited/late use of hydroxychloroquine.

Theoretically **that number of daily deaths could be reduced to just 7** (at 1%) or **even just 2 per day** (at Zelenko's 99.7% recovery rate), if the U.S. were to adopt the Zelenko Protocol nationwide.

Beginning back in March, Dr. Vladimir Zelenko and his team saw 2,200 COVID-19 patients in Monroe New York and, in all, only lost 2. One that had advanced leukemia and the other that sought treatment far too late during the course of his infection. Zelenko sent about 2/3 of the younger and healthier patients home to get better on their own with close monitoring, and **treated the remaining 1/3 elderly and high-risk patients with comorbidities** - and all patients that presented with shortness of breath - *immediately upon the presentation of symptoms or clinical suspicion of COVID-19* with **hydroxychloroquine+zinc+Azithromycin** (or Doxycyclene), without waiting for the (often unreliable) results of a COVID-19 test to be returned. **That's a 99.9% recovery rate over 2,200 patients and a 99.7% recovery rate among his treated elderly and high-risk patients** through immediate treatment, while the entire cost of the off-patent time-tested medications totaled about \$14-\$20. Far from being obscure, the Zelenko Protocol is today prescribed all around the world and has been adopted by entire nation-states. World renowned French virologist and epidemiologist Dr. Didier Raoult found COVID-19 to be one of the easiest viruses to cure - provided it is treated with HCQ+AZ without delay.

Dr Brian Tyson saw over 17,000 patients and treated 1,900 of them that were COVID positive, from 11 months old to 90 years old, with 0 deaths and only one hospitalization of 4 days.

What kind of legacy will the leaders of the Bahamas leave behind for future generations to remember this chapter in Bahamian history by? As having been sharp enough to have adopted a safe, inexpensive, 99+% effective treatment protocol, that allowed their citizens to fearlessly and confidently pursue and enjoy life normally again with open markets and borders and their beautiful smiles showing - while suffering only a tiny fraction of the viral deaths of even a normal flu season, from COVID-19, as they reach herd immunity perhaps within months - with a \$14 treatment protocol employing safe, reliable old medications that are taken by millions of people every day, that eliminate the need to even consider squandering the nation's resources on any expensive new patented therapeutics that come along, much less risking immunological or neurological damage to Bahamian citizens through a completely unnecessary and rushed vaccine, the long term negative side effects of which will not be known for many years.

Or will the leaders of the Bahamas be remembered for repeatedly banishing their citizens to their hidey-holes and sending tourists packing and bankrupting businesses, while collapsing the Bahamas' economy once again in yet-another round of whack-a-mole, every time COVID-19 now predictably, expands again?
